Quadratic equations: a first step (sample)

Lesson 1 • v1

Choose a method and check a proposed root.

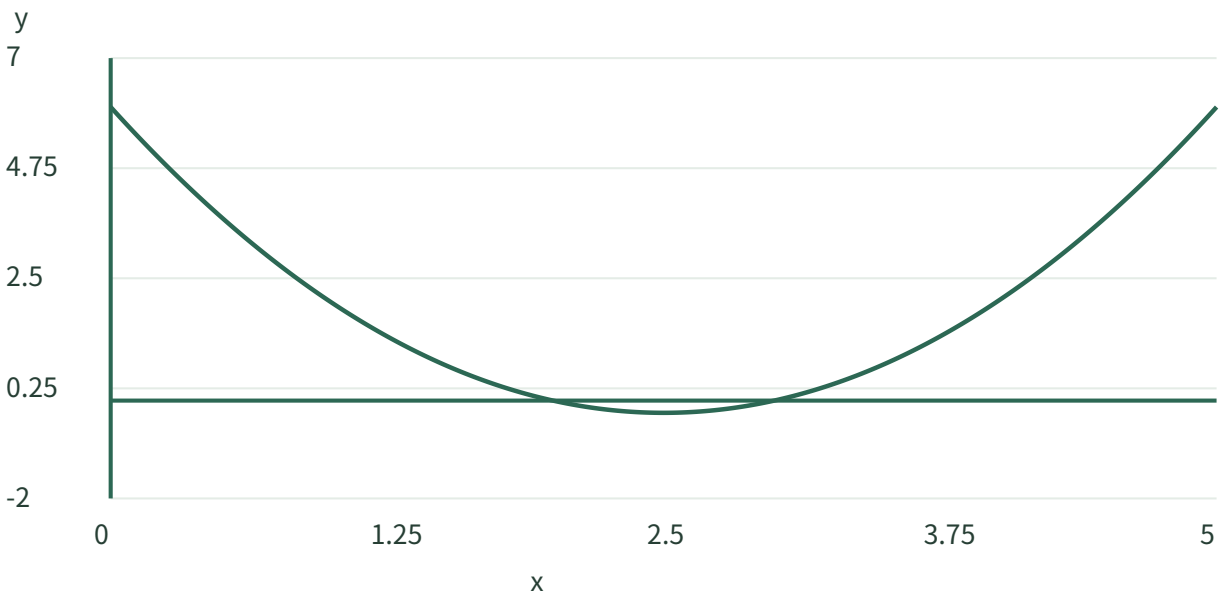
Choose the right method

A quadratic equation has a non-zero quadratic coefficient.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Method 方法	When to use 適用情況
Factorisation 因式分解	Simple factors 容易找出因式
Formula 求根公式	General case 一般情況

Roots and intersections



1. $y = x^2 - 5x + 6$ • x^2-5x+6

Q1

Solve $x^2 - 5x + 6 = 0$ and explain your first step.

Your working:

Recall tomorrow

Explain why you chose your method before looking at the notes.

Continue with your tutor

Return to the chat with Lesson 1, v1 and the question number. You can request hints or a worked answer. Try recalling the key idea tomorrow.
